28 TO COME

## Detection of Bile and Blood Pigments in the Urine.

A layer of fine, white sand, several mm. in thickness, is spread upon a plate and a little of the urine poured into it. If the urine contains pigment, the sand will be stained in a characteristic manner, a brown stain indicating the presence of hemoglobin, a greenish stain that of bile pigment. The test is said to be trustworthy as well as convenient.—*Lipp; Münch. Med. Woch.*

Weather

Temp.

A fine day  
until about four then  
it rained a little. Eugene  
& Ale<sup>x</sup> was over for  
dinner. We was home  
all day. Carl went  
home for dinner. Turned  
the cars down in  
the woods
