262 DAYS PAST

103 TO COME

Impacted Cerumen.

In cases of hardened wax in the ear, do not attempt its removal by the ear spoon or by repeated syringings with warm water. Simply drop a few minims of glycerine into the ear and allow it to remain for twelve hours; then the syringe will easily and quickly remove the softened mass. If one application does not relieve, it may be repeated. Peroxide of hydrogen, one part, with water, three parts, will also remove the wax.—*Ohio Med. Journ.*
