Iodine in Smallpox.

C. S. Rockhill finds that by painting the pustules of smallpox with a ten per cent. solution of iodine in glycerin, the pustules dry up and destruction of the tissue, with consequent pitting, is prevented. The duration of the stay in hospital is shortened. The pustules may be opened with a sterile instrument and touched with tincture of iodine. The author has treated 85 patients in this way, and all have recovered, with an average stay in hospital of twelve days.—J. A. M. A.

Weather

Temp.

Cold & rained a little this morning I took Mella to school & Maudie did the ironing. John has been cultivating the corn & Joe hoeing in the garden. I got the Cheese Cheque. Maudie went for Mella. John planted in his corn again where the crows took it out.
