Congenital Heart Disease.

A child with cyanosis, and either an enlarged heart or a thrill or both, has probably a congenital pulmonary stenosis. If this is the only lesion, an early death is the rule; if the ductus arteriosus is patent, however, the prognosis is fairly good. A congenital cardiac murmur, without cyanosis, but with cardiac enlargement, is usually due to a defective interventricular septum. If there is a murmur, without either cyanosis or enlargement, especially if the murmur is markedly transmitted into the vessels of the neck, or if it extends into diastole, the case is probably one of open ductus arteriosus alone. When the murmur is a 'hummingtop' note and extends throughout the cardiac cycle, the diagnosis of the lesion is almost certain. The prognosis in these cases is very good.—
Dunn; Amer. Journ. Dis. Child.

Weather

Temp.

a very stormy day
a blustery not very cold only
that the wind blew so hard
Bill Brandt came down to help
John draw hay but it was
so stormy he was here for some
time John went to Hingemul
for the chopp. Then to Aylmer
for medicine for Mella. Beel
has over this morning. The little
man cow Beauty came in tonight

She is three years old
