47 TO COME

## Pediatric Pointers.

In all stages of acute appendicitis in children operation should follow immediately on diagnosis; the signs and symptoms may be slight, with very serious conditions in the abdomen, and only surgeons with a very wide experience may, in rare cases, be justified in waiting for convalescence before performing their operation.

In many patients with tonsils and adenoids, the temperature, if carefully taken at frequent intervals, will show an increase over the normal. Here the explanation is probably to be found in a focus or foci of infective material.—*Med. Times.*
