Foreign Bodies in the Nose.

A long-standing purulent discharge from one nostril occurring in a child is a pathognomonic sign of a foreign body in that situation. If the discharge is very offensive, the foreign body will be found to be porous, capable of absorbing and retaining fluids in its substance. The ordinary ozæna occurring in children invariably affects, before long, both nasal cavities.—Clinical Memoranda, Brand & Keith.

Weather - I snowed a little Temp.

but an nice day. Maude & Belle started my dress this morning girls both went to school. John went to Aylesmer with Angus & Smith & got him a new pair of overalls. Mr Rutherford was well enough to come back to school
