

The Post-Typhoid Tonic.

It is usually at this season of the year that Typhoid Fever exhibits its maximum incidence, especially in the larger cities. One probable reason for this is the return of the army of families to city homes from the many more or less unsanitary summer resorts in country districts during the stage of incubation, and the subsequent development of the characteristic symptoms of the disease. As every physician realizes, the systemic poisoning is usually profound and the duration of the infection is such that the organism is almost always distinctly depreciated and devitalized after the four, five or six weeks febrile period. This condition of general systemic depression at the beginning of convalescence certainly indicates the necessity of reconstructive measures. As soon as it is safe to gradually increase the patient's dietary, it is also wise to commence tonic and hematinic treatment. Care must be taken, however, to avoid derangement of the digestion, and for this reason, **Pepto-Mangan (Gude)** is especially indicated as the most efficient, readily tolerable and generally efficient reconstructive and hematic. This organic combination of the peptones of iron and manganese never creates aversion, destroys the appetite nor causes gastro-intestinal irritation. Through its regular use Typhoid Convalescence is promoted and distinctly hastened.
