164 DAYS PAST

201 TO COME

A Diagnostic Sign in Gall-Stones.

Abrahams, of New York, tells of finding a physical sign in this condition which has never failed him nor been absent in any case of cholelithiasis in the many years that he has observed it. It consists of finding a painful point midway between the umbilicus and the costal cartilage of the ninth rib in the right hypochondrium.

His method of finding the sign is as follows: Place the patient in the recumbent position with arms and legs extended. Find the point midway between the umbilicus and the ninth costal cartilage; then with a sudden thrust press the index and middle fingers of the right hand into that point.

Weather

Much cooler

Temp.

John was drawing gravel  
& Eugene was cultivating  
the summer flowers & harvesting  
the corn & cultivated the  
potatoes in the garden.  
Mrs Cox & Evelyn was over.  
Eugene went to Aymer  
with Clarence
