102 DAYS PAST

Friday

264 TO COME

Asphyxia of the Newborn.

Freund describes an ingenious method of treating asphyxia neonatorum. He calls the method placental aëration. The placenta is delivered manually as soon as the child is born and is seen to be asphyxiated. The child is placed in warm water and the placenta held with the maternal surface upward, the cord not being cut as yet. A stream of oxygen is turned on to the maternal surface of the placenta, whereupon the child recovers its color, the pulse comes up and respiration is established. Then the cord is cut.—*Critic and Guide.*

Weather *Cloudy and windy.* Temp.

Boyd was here for dinner, and helped Pa clean up seed oats all day. Cecil was over to night. Mr. Appleford came for Grace early and stayed for tea. Mr. Thompson and Mae took rest of seed to be cleaned. Mother finished braiding bottom of jumpers.
