

The Blood Current of the Aged

In old age the heart loses its pumping capacity, the arterial walls soften and the blood stream lacks sufficient force to properly circuit the lungs and receive oxygen.

Increase the hemoglobin and the red corpuscles in the blood of the aged subjects and nutrition can be maintained at the proper standard.

Pepto-Mangan ("Gade")

makes the blood rich in hemoglobin and red corpuscles, intensifies its affinity for oxygen and invigorates arterial circulation. It exhibits its blood-enriching, strength-imparting and regenerative properties most conspicuously when administered to persons of advanced age.
