New Method of Administering Ether.

Harold A. Lucas, Albany, N. Y., recommends for accurate dosage the following method of administering ether by the drop method. The top of the ether can is cut off and over it is placed an ordinary rubber nipple which has been punctured by means of a pin. The nipple is fixed firmly with a rubber band. Holding the can horizontally one can get a slow issuance of drops of a uniform size. There is neither leakage nor waste and only a small amount of ether is needed.—*Medical Record.*
